

Full-Stack Developer Intern — Practical Assignment

Estimated time: ~1 day | Stack: Next.js + a public API | Deploy: Vercel / Netlify

Welcome, and thanks for applying. This assignment checks four things at once: your UI/UX sense, your ability to write and ship working code, your deployment workflow, and how well you direct AI tools while still understanding what you build. Read this brief fully before you start. Some requirements are specific on purpose. Building from a quick skim will produce a submission that does not match the spec.

1. What to build

Build a **Movie Discovery App** in **Next.js** that fetches data from a free public API and lets users browse, search, view details, and save favorites. Frontend + a public API is enough; you do not need to build your own backend or database.

- **Browse:** a responsive grid of movies showing poster, title, release year, and rating.
- **Search:** users can search by title and see results update as they type.
- **Details:** clicking a movie opens a detail page or modal with the full overview.
- **Favorites:** users can add/remove favorites that persist after a page reload (localStorage is fine).
- **States:** show a loading indicator while fetching, and a clear message on error or no results.

2. Data source

Use the free **TMDB API** (themoviedb.org — sign up for a free key). If you prefer a different free public API, that is acceptable, but state which one you used in your README.

3. Specific requirements (read carefully)

These are firm. They exist so we can see whether you read and understood the spec rather than auto-generating a generic app. Each is easy to satisfy once you have read it.

R1 — Pagination, not infinite scroll

The browse grid must use **manual pagination with Next / Previous buttons**. Do **not** use infinite scroll or an auto-loading grid. Show **exactly 12 results per page** — no more, no less.

R2 — Repository name

Name your GitHub repository **movie-finder-[yourfirstname]** (e.g. movie-finder-aditya). All lowercase.

R3 — AI log file

Include a file named **AI_LOG.md** in the repo root with three sections, in this order: **Tools Used**, **Best Prompts** (paste 2–3 of your strongest prompts with one line each on why they worked or how you refined them), and **What I Fixed Manually** (describe at least one thing the AI got wrong that you corrected by hand).

R4 — Footer marker

Add a small footer to the home page with the exact text: **Built for Jeevan — [your name]**. This is how we confirm the app is yours.

4. How to submit

Reply in this Internshala chat with all four of the following:

- **Live URL** — a working deployment on Vercel, Netlify, or similar.
- **GitHub repo** — public, named per R2, with a README that explains how to run it locally.

- **AI_LOG.md** — present in the repo as described in R3.
- **Confirmation line** as the first line of your reply (see the box below).

First line of your reply — required

The **very first line** of your Internshala reply must be exactly: **FS-INTERN-2026 :: [Your Full Name]**. Replies that do not begin with this exact line may be filtered out and not reviewed.

5. Deadline

Submit within **[24–30 hours — fill in exact date & time]** of receiving this. If you cannot finish everything, submit what works rather than nothing: an honest, partly-complete app with a clear AI_LOG.md is more useful to us than a polished one with no insight into how you built it. Do not request extensions.

6. How we evaluate

Area	What we look for
UI / UX	Clean, responsive, intuitive; loading / error / empty states handled.
Code & functionality	All features work; organised components; no broken flows.
Deployment	Live URL opens and works on first click.
AI workflow	AI_LOG.md shows real prompting skill and genuine understanding.
Attention to spec	R1–R4 and the required reply line followed exactly.

A genuine note on using AI: we expect you to use AI tools — that is part of the job. What we are measuring is whether you can direct them well and still understand and own the result. The most common reason a submission fails is not weak design; it is missing the specific requirements above because the brief was fed to a tool without being read. Read first, then build.

Good luck — we are looking forward to seeing what you ship.
